R1: nominal OPE vs the truth as hidden confounding grows (top: n = 2,000)
prognostic channel κp = 0
prognostic channel κp = 0.5
prognostic channel κp = 1
advantage of 'withhold antibiotics' over the clinicians (value)
share of datasets that deploy the truly worse policy
true confounding strength Γ* (MSM, log scale)
nominal WIS (mean, 95% of datasets)
nominal MB (mean, 95% of datasets)
sort bound at Γ = Γ* (median)
nominal, infinite data (exact)
true advantage
half the datasets
WIS, n = 2,000 (95% CI)
WIS, n = 10,000
MB, n = 2,000 (95% CI)
MB, n = 10,000
